Instructions
LANLOC™
Locks for LANs and other RJ-45 Modular Plugs

The LANLOC™ helps secure your Local Area Network (LAN) or other RJ-45 modular connections. Once installed, it cannot be removed without destroying the LANLOC™ or attached equipment.

Changing your connections is easy, if you have a replacement LANLOC™. Just cut the existing LANLOC™ out, make your changes, and secure with a replacement LANLOC™. No special tools are needed.

Ask about our MODLOC™ for securing your RJ-11 and handset modular connections.

To Install: (see diagram on back of card)

1. Using diagonal cutters or other suitable tool, remove the locking tab on your modular plug as shown in drawing.

2. Slide LANLOC™ into jack on top of modular plug, make sure it "snaps in".

To Remove or Change:

1. Cut along the two grooves on the top of the LANLOC™. Pull out the pieces.

2. Make your changes.

3. Reinstall modular plug with new LANLOC™ as above.
